Software Proxy Memory Interface

A software program executing in the microprocessor, it works in coordination with the external bus interface (EBI) or the internal interconnect bus to access and control various memories. The memory comprises DRAM and the flash memory. The software program can be a firmware, a microcode, or implemented in the FPGA.

Software Proxy Memory Interface (SPMI)

■ The technical terms of major EBI signals:

A[a]	address bus, said 'a' is address width
D[d]	data bus, said 'd' is data width
#CS; #CE	chip selection on the host side; chip enable on the device side
#WE	write enable
#OE	output enable

Timing Diagram of EBI

$$t_{EBI} = t_{ASU} + t_{ACC} + t_{AHD}$$

$$\text{Bus Frequency} = \frac{1}{t_{EBI} + t_{NAI}} \parallel \text{Bus Frequency} \leq 200\text{MHz}$$

$$\text{Random Access Cycle} = t_{EBI} + t_{NAI}$$

$$\text{Burst Access Cycle} = t_{ACC} + t_{NAI}$$

■ The time parameters for DRAM:

Data Retention Time on the Cell: tDRC

Average Periodic Refresh Interval: tREFI (refer to DDR-n SDRAM specification)

Refresh Cycle Time: tRFC (refer to DDR-n SDRAM specification)

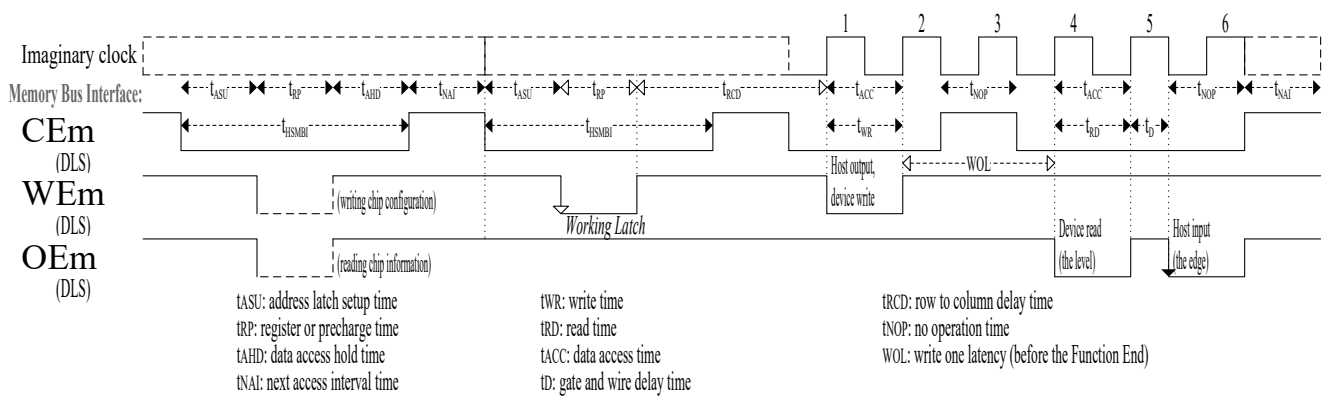

Write One Latency: WOL

High Speed Memory Bus Interface (HSMBI)

The high-speed memory bus interface using a high-speed transmission hardware to speed up accessing main memory. The interface is based on the external bus interface, and improving the timing sequence to enhance performance.

The signals on the interface are used a class of Low Voltage Differential Logic Signal (LVDS); the address bus and the data bus are used a type of Low Voltage Logic Signal (LVLS); the access signals are used a type of Differential Logic Signal (DLS), or the LVLS.

Timing Diagram of HSMBI

➤ Symbol and Definition:

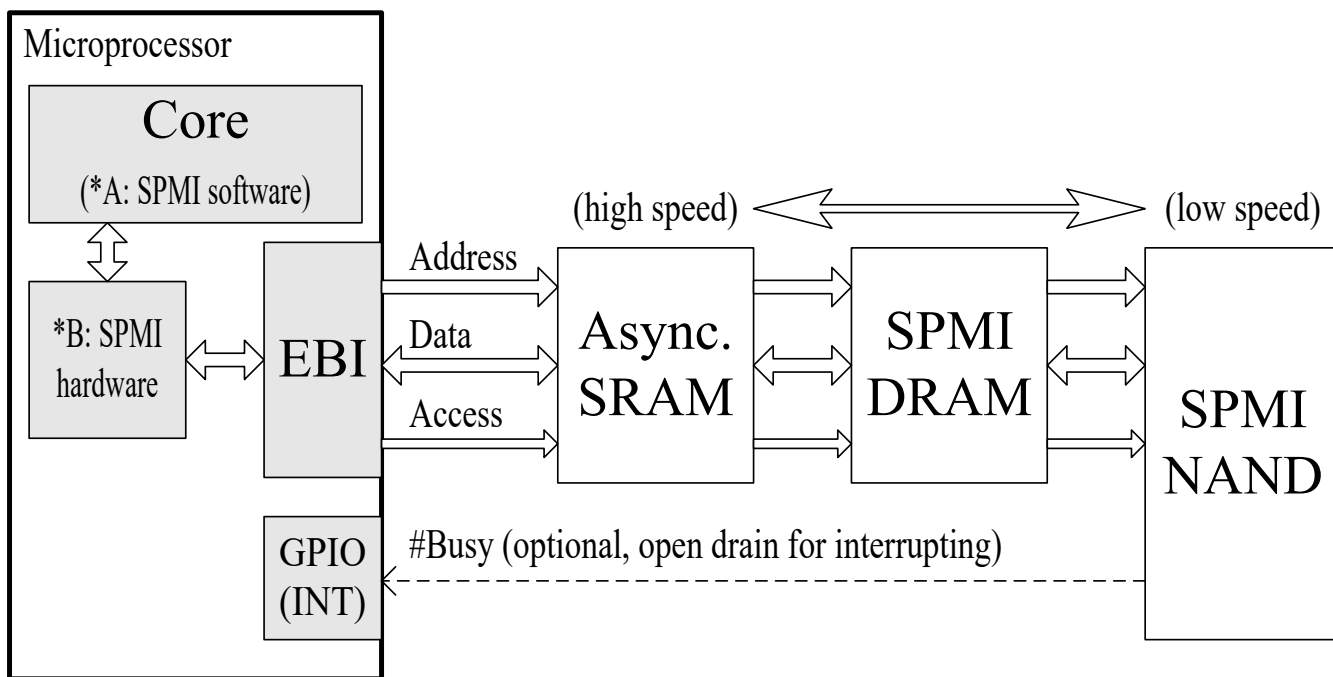

tASU	address latch setup time	tWR	write time	tRCD	row to column delay time
tRP	register/precharge time	tRD	read time	tNOP	no operation time
tAHD	data access hold time	tACC	data access time	WOL	write one latency
tNAI	next access interval time	tD	gate and wire delay time		

$$t_{HSMBI} = t_{ASU} + t_{RP} + t_{AHD}$$

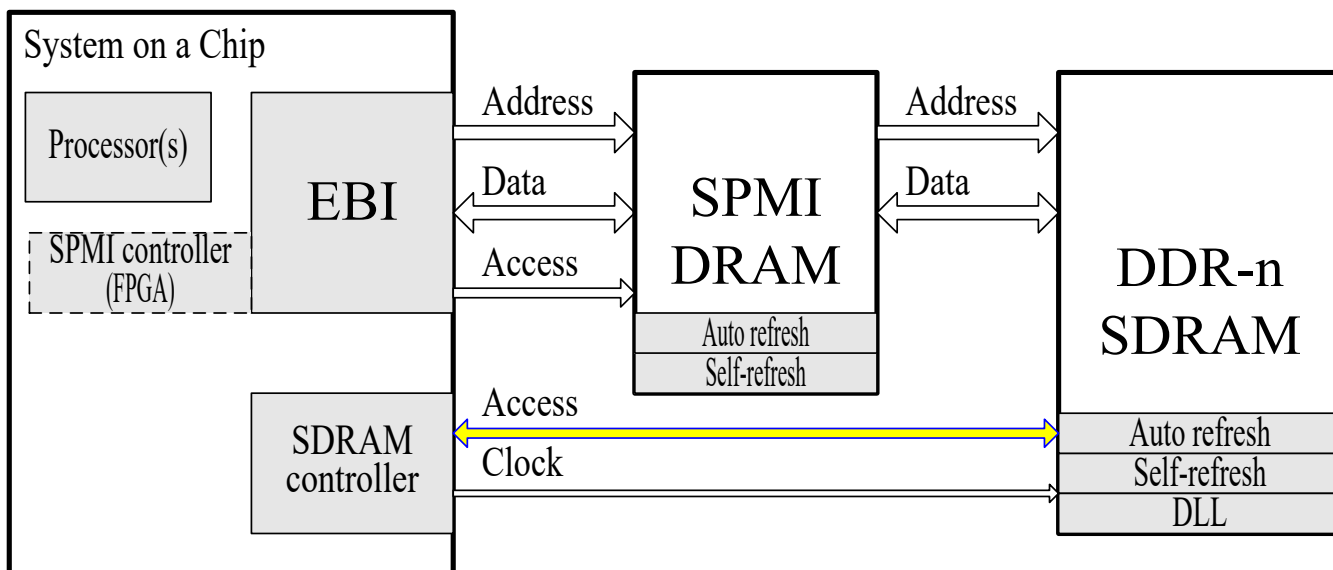

$$Bus\ Frequency = \frac{1}{t_{HSMBI} + t_{NAI}} \parallel Bus\ Frequency \geq 100MHz$$

$$Memory\ Access\ Cycle = t_{ACC} + t_D$$

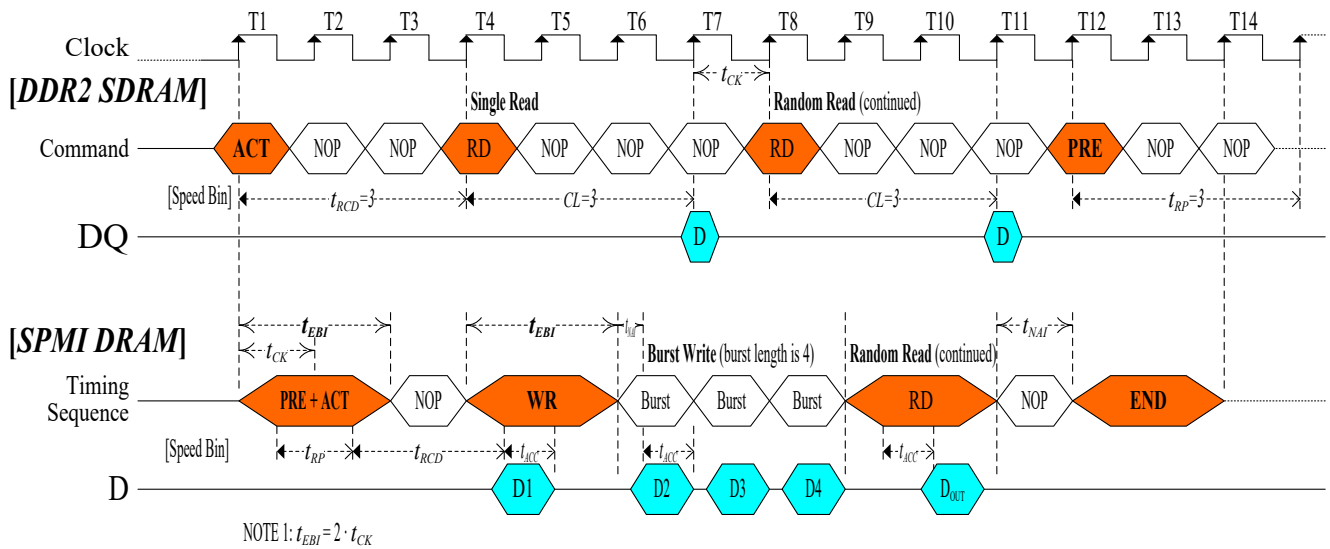

Hardware Platform Architecture

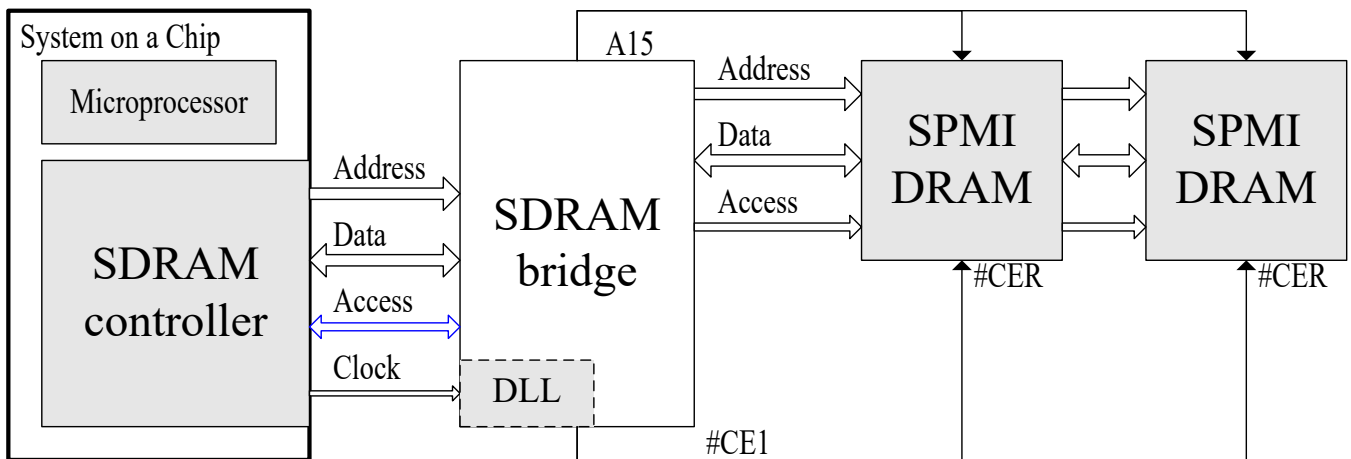

SPMI DRAM versus DDR-n SDRAM

SPMI DRAM versus DDR2 SDRAM

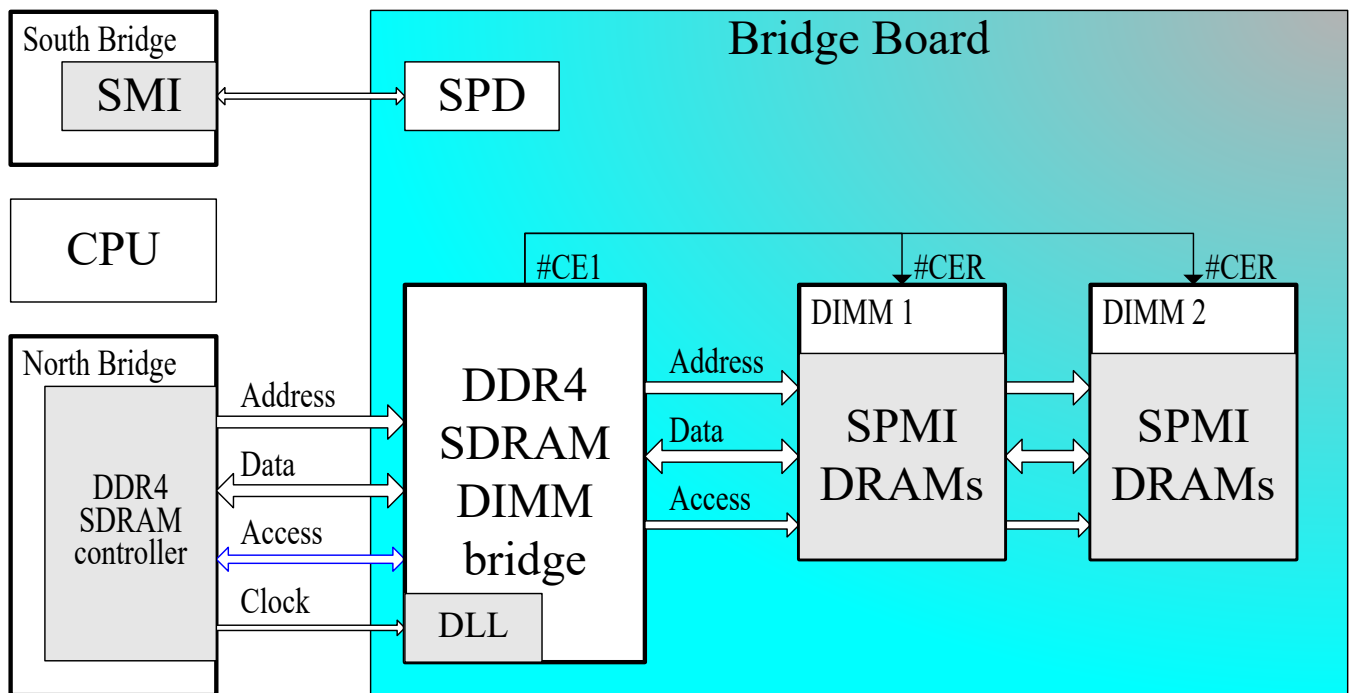

SDRAM Bridge: hardware platform of SoC

SDRAM DIMM Bridge: hardware platform of X86 personal computer

SDRAM DIMM Bridge Board: hardware platform of X86 personal computer

Package Ball-out

DDR2 SDRAM package mapping table

The package ball-out please refer to “JEDEC STANDARD, DDR2 SDRAM SPECIFICATION”.

Input/output of DDR2 SDRAM interface on the device side, and mapping to SPMI

SPMI DRAM

Applying to a high performance dynamic random-access memory.

Parameters of speed bin: t_{RCD} (row to column delay time), t_{ACC} (access time)

■ Symbols

Address width of bank: b

Address width of row: r ($r \leq 14$)

Address width of column: c ($c < r$)

Mount of storage cell: n

Operation Time of Accessing and Refreshing

■ The device refresh parameters

t_{DRC} : decided by the struct of the storage cell, the process technology, and the 'n'

$$t_{REFI} = \frac{t_{DRC}}{n} \parallel n = 2^x, x \geq 7$$

$$t_{RFC} \cong t_{RP} + t_{RCD} + t_{ACC} + t_{NOP} + t_{NAI} \parallel gate\ delay$$

■ The time of random access (t_{RACC}) with data amount (DA)

$$t_{RACC} = t_{RCD} + t_{NAI} * DA + t_{EBI} * (2 + DA)$$

■ The time of burst access (t_{BACC}) with data amount (DA)

$$t_{BACC} = t_{RCD} + t_{NAI} * DA + t_{EBI} * 3 + t_{ACC} * (DA - 1)$$

Command Set

Function	A[15:14]	A[r-1:0]	D[7:0]
Data Access	01	Column Address* ¹	Byte
Single Bank Precharge, Random Access	01	Row Address	Bank Address
Single Bank Precharge, Synchronization Burst Access* ²	01	Row Address	Bank Address
Function End	00	X	X
Read Chip Information	00	Page Number* ³	V (hardware fixed)
Write Chip Configuration	00	Page Number* ³	V (power on reset)
Auto Refresh (all bank)	1X	Activating #CER* ⁴	

NOTE 1: the device first receives the row address, and then receives the column address (A[c-1:0]) after.

NOTE 2: rolling column address.

NOTE 3: using A[1:0] only.

NOTE 4: several #CER (#CE for refresh) connect to same #CE to be a refresh group.

Release Note

Table of Release Note

Version	Release Date	Release Note
1.0	2020-05-11	First formal version.
1.1	2020-05-18	According to the asynchronous SRAM chip which can select data width is single byte or double byte, the package ball-out can add the #UB and #LB.
1.2	2020-07-27	To add SPMI DRAM versus DDR2 SDRAM.
1.3	2020-08-03	<ol style="list-style-type: none"> 1. To beautify SPMI DRAM versus DDR2 SDRAM. 2. To beautify timing diagrams and correct symbols on them. 3. To correct the operation time of accessing. 4. To correct some error words.
1.4	2020-08-24	<ol style="list-style-type: none"> 1. To define clearly, the symbols CK and #CK are reserved signals. 2. To rename the "Speed Write" becoming "Fast Write". 3. To add a write mode in MRS, and remove the Fast Write from command set. 4. To rename the "Write" in timing diagram of SPMI DRAM. 5. To rename the "Operation Time of Accessing and Refreshing" in SPMI SRAM. 6. To change the number of the Fast Write in SPMI SRAM. 7. To rename the "SPMI NAND Flash Memory". 8. To change the number of the Random Write in SPMI NAND. 9. To correct some symbols in timing diagram of SPMI NAND. 10. To add an approach of a bridge board.
1.5	2021-04-12	<ol style="list-style-type: none"> 1. To correct the command set and the timing diagram of SPMI DRAM; and to exchange the read and write timing diagram (SPMI SRAM), by the way. 2. To modify the Platform Hardware Architecture. 3. To modify the architecture of SPMI DRAM, and SPMI SRAM.
1.6	2021-08-02	<ol style="list-style-type: none"> 1. Fixed some bugs of all timing diagram. 2. Fixed command set of burst access. 3. Merge SPMI DRAM with SPMI SRAM.
1.7	2021-09-13	<ol style="list-style-type: none"> 1. Fixed some bugs of all timing diagram. 2. Remove the power down command in SPMI DRAM. 3. Modify the Mode Register. 4. Modify the Operation Time of Accessing and Refreshing.
1.8	2021-09-20	<ol style="list-style-type: none"> 1. Modify the command set and the function number in SPMI DRAM. 2. Modify the quantity of periodic refresh command. 3. Modify the function name in SPMI NAND.
1.9	2021-09-27	Modify the SDRAM bridges.
1.10	2021-11-22	Modify the SPMI DRAM versus [DDR-n] SDRAM.

1.11	2022-02-07	<ol style="list-style-type: none"> 1. Fixed the figures (Platform Hardware Architecture, and SPMI DRAM versus [DDR-n] SDRAM). 2. Fixed the command set of SPMI DRAM.
2.0	2022-03-28	<p>To upgrade SPMI DRAM and SPMI NAND.</p> <p>To reduce GPIO operation times (switching GPIO is usually slower).</p>
3.0	2022-04-08	<p>To upgrade SPMI DRAM and SPMI NAND.</p> <p>To remove all GPIO (it is not fast on advanced hardware and software platforms).</p>
3.1	2022-07-25	<ol style="list-style-type: none"> 1. To add EBI DRAM. 2. Fixed all of the Package Ball-out. 3. To beautify the Timing Diagram of EBI. 4. To beautify all of the Timing Diagram.
3.2	2022-08-29	<ol style="list-style-type: none"> 1. To add DDR3 SDRAM package mapping table. 2. The ALE is no more an option on SPMI NAND. 3. To redefine the tDACC and tBACC, and tDACC is changed to tRACC. 4. To shift the location of Operation Time of Accessing.
3.3	2022-09-26	<ol style="list-style-type: none"> 1. To add Simplified State Diagram. 2. Modify Chip Information.
3.4	2022-10-10	<ol style="list-style-type: none"> 1. Modify the waveforms of burst write and burst read. 2. Modify the Simplified State Diagram.
3.5	2022-11-14	<p>Fixed the definition of EBI.</p> <p>Fixed "The device refresh parameters".</p>
3.6	2023-01-12	<p>Fixed the package mapping table.</p> <p>Fixed the formula of tRFC.</p> <p>Rename EtST to ST.</p> <p>Modify the Chip Information, and remove not needed fields.</p>
4.0	2023-02-06	To add HSMBI DRAM.
